

EnkTel IPTV

Testers Guide · version 1.66.0 (build 179)

Installing

Builds are sideloaded from the GitHub release. Two APKs are published per release: **tv** for Android TV and Fire TV, **mobile** for phones and tablets. Install the one matching the device — they are separate builds, not one file that adapts.

- **Fire TV** — install via Downloader or ADB. No developer certificate is needed.
- **Android TV** — allow installation from the source you are downloading with, then open the APK.
- **Phone / tablet** — open the APK and allow installation when prompted.

This release carries a database migration. Installing over an older build is safe and keeps your data; going back to 1.60.x afterwards is not, and needs app data cleared first. Test the upgrade path over your existing install before wiping anything — an upgrade that loses profiles is exactly the bug worth catching.

What changed in 1.66.0

Change	What to look at
The paid layer is gone	No trial signup, no upgrade screen, no checkout. Confirm nothing anywhere still offers to sell a subscription, and that no screen links to a page that 404s.
Free tier has a film library	A fresh install with no source should reach both live channels and a Movies library with artwork. Check the titles play, not just that they list.
Bring your own film library	Onboarding and Settings both accept an on-demand playlist URL. Its titles must land under Movies, never in the channel list.
Catalogue sync memory	A large catalogue should sync without the app being killed. This is the fix worth re-checking on the smallest device you have.

What to exercise

Worth the most attention

- **Upgrade from your existing install.** Profiles, favourites, watch progress, recordings and downloads must all survive.
- **First launch on a clean install.** With no source configured you should end up watching something, not staring at a login form.
- **A film library URL of your own,** entered at onboarding and again in Settings. A URL that is not a playlist should fail visibly rather than silently.
- **Playback on the weakest device you have.** A 1 GB stick is where memory and buffering problems appear first.

Also worth a pass

- Live and on-demand buffer profiles, including whether a smaller live profile helps a stuttering channel.
- Subtitle styling on live TV as well as on films — the two used to be styled by different code.
- Aspect cycling: Fit, Stretch, Zoom, and back to Fit.
- The dock: playback continuing while you browse, and returning to full screen.
- Remote and D-pad reach on every screen — anything focusable should be reachable, and the focus highlight should sit on what is actually selected.

Known constraints

Behaviour	Why
Multi-view needs two connections	It opens a second stream. A line limited to one device cannot show two pictures; this is the provider's limit, not a bug.
The free film library is English-language	It is drawn from curated public-domain archive collections, which hold effectively nothing in Croatian, Serbian or Bosnian. Not a gap in the app.
A film library that fails to load is silent	It is deliberately best-effort so that a failed download cannot take your channels down with it. Check the sync summary to see whether titles arrived.

Reporting

A report that can be acted on says:

- **Device and OS** — model and version, plus whether it is the tv or mobile build.
- **App version** — 1.66.0, build 179. Settings → About shows it.
- **Source type** — Xstream, M3U, or the free tier. Never send credentials.
- **What you did, what happened, what you expected** — in that order.
- **Whether it repeats**, and whether it also happens on the previous build.

Settings → About carries diagnostics and any crash report. Attach that rather than describing it. Redact the server address and username if the report includes them.
