

EnkTel IPTV

User Manual · version 1.66.1 (build 180) · Android TV, Fire TV, phone and tablet

Getting started

EnkTel plays the channels and films you already have access to. It is a player, not a provider: you point it at a source, and it shows you what that source carries.

Your first launch

If you have no source set up, EnkTel opens on free-to-air television straight away — a lineup of public channels that need no account, plus a library of public-domain and openly-licensed films under Movies. You can watch immediately and add your own source later.

Adding your own source

- **Xtream Codes** — enter the server address, your username and your password.
- **M3U playlist** — enter the playlist URL, and an EPG/XMLTV URL if your provider publishes one separately.
- **Film library** — optional, and offered with either of the above. This is an on-demand playlist: its titles are filed under Movies rather than mixed into the channel list.

Credentials are stored on the device and are not sent anywhere except to the provider they belong to.

Finding your way around

Section	What it holds
Home	Continue watching, plus rails drawn from across your catalogue.
Live TV	The channel list. Number entry jumps straight to a channel.
Guide	The programme grid, with a preview of the highlighted channel.
Movies / Series	On-demand titles, with details, artwork and episode lists.
Sports	Fixtures and live scores; a finder for what is on now.
Watchlist / Lists	Titles you saved, and lists you made yourself.
Recordings	Scheduled and completed recordings.
Downloads	Titles saved to the device for offline playback.
Search	Across channels, films and series at once.
Settings	Everything below.

Watching

While a stream is playing

Control	What it does
Aspect	Cycles Fit, Stretch and Zoom. Fit preserves the picture's shape; Stretch fills the screen and distorts; Zoom fills the screen by cropping.
Subtitles	Picks a track. Styling is set once in Settings and applies to live and on-demand alike.
Audio	Picks a language or track where the stream carries more than one.

Dock	Shrinks playback into a corner window so you can browse without stopping it.
Multi-view	Two streams side by side.

Multi-view opens a second stream, so it needs a source that permits two simultaneous connections. On a line limited to one device the second picture will fail to start — that is the provider's limit, not a fault in the app.

Catch-up and recording

Where a provider offers catch-up, past programmes are reachable from the guide. Recordings can be set to start early and end late, which is worth doing because broadcast schedules drift; both paddings are in Settings under Recording.

Real-Debrid

Real-Debrid is a service you subscribe to separately. It takes a link you already hold and returns a direct, unthrottled one, and it holds whatever you have added to your own account. EnkTel is a client for that account: it presents your token, reads back what the service says is yours, and plays it.

Connecting it

Settings → Playlists → Real-Debrid, and paste the API token from your account page on real-debrid.com. The screen is empty and does nothing without one.

What the screen does

Search my account	Matches release-style filenames, so “the batman” finds The.Batman.2022.2160p.mkv. It searches your account and nothing else.
Play a link	Paste a hoster link you hold; Real-Debrid turns it into a direct one.
Add a magnet	Paste a magnet you hold. See below.
My downloads	Your download history, already direct, so these play at once.
In my account	Files in the account. Resolved when you play, because an unrestricted link expires. A row holding several files says so — open it to pick an episode.

Adding a magnet

EnkTel first asks Real-Debrid whether it already holds that torrent, because the answer changes what to expect: a cached one is ready in seconds, and one that has to be fetched can take minutes. It then adds it and asks which files you want.

Where a torrent has several files, videos are ticked for you and samples are not — change it before you confirm. Fetching a season pack whole pulls every episode to watch one, which is what the picker is there to avoid.

The screen then waits about two minutes and plays it. If the download is still going when that runs out, nothing has failed: your account carries on fetching, and the title appears under In my account when it lands.

What it will not do

Nothing on this screen searches anywhere for content. Every link is one you supplied or one already in your account — Real-Debrid publishes no endpoint that looks for titles, and EnkTel does not go anywhere else to find them. Requests are also spaced deliberately: the service counts refused requests toward its own rate limit, so an app that asks too quickly gets the account blocked rather than the answer sooner.

Settings

Playlists	Add, sync, export and remove sources. Import a playlist file from the device. Set a film library or a provider-specific User-Agent per source. Manage categories, and test network speed.
------------------	--

Playback	Subtitle colour, edge and background; loudness normalisation; auto-play next episode; skip intro; picture-in-picture and the dock.
Recording	Start-early and end-late padding, the download folder, dialogue boost and an EPG timezone offset.
Network	Buffer profiles for live and on-demand separately, and a minimum buffer override.
Parental	A PIN that gates restricted content.
Sports & Voice	Live scores, the sport finder, and the teams you follow.
Real-Debrid	Your API token, and the account screen described above.
Appearance	Theme and layout.
About	Version, diagnostics and crash reports.

Downloads

Saved films and episodes play offline. Where they are kept is worth setting once: by default they go to a folder Android keeps private to the app, which means uninstalling clears them and no file manager can open it. Settings → Recording → Pick download folder puts them somewhere ordinary instead — one that survives uninstalling and can be read from a PC over USB.

Each finished download has a folder button. Where you have picked a folder it opens it; where you have not, it explains why nothing can and offers to set one. Changing the folder affects future downloads — files already saved stay where they are.

Sending a download to a PC

Tap Send to PC on the Downloads screen. The app shows an address and a PIN; type the address into a browser on a computer on the same Wi-Fi, enter the PIN, and pick a title to save it. There is nothing to install on the computer, no account, and the file does not leave your home network.

The PIN is new every time you start, and ten wrong attempts stop the server until you start it again. It keeps running while you use the rest of the app; stop it from the Downloads screen or from its notification. Large files resume by themselves if the connection drops. Sending needs Wi-Fi — on mobile data the app will not open a server, because there the local network is your carrier's.

Using the EnkTel app on your PC instead

A browser is enough, but the EnkTel desktop app does the same job with less typing. Open My devices and it looks for phones and TV boxes that are sharing, so there is no address to read off a television screen. Pick the device, type the PIN once, and it lists what is ready to copy across. Choose a folder and Get all takes every finished download into it, one after another, without asking again per file.

The same screen shows what that device is still downloading and lets you pause, resume, retry or cancel any of it from the PC — the download itself carries on running on the phone, so it keeps going when you close the laptop. A transfer that is interrupted picks up from the byte it reached rather than starting the film again. Cancelling a download removes it from that device and deletes what it had already fetched, which is why the app asks first; nothing already saved on the PC is touched.

Renewing your line

When a line is within a fortnight of running out, the account panel says so and offers a link to renew it. The link carries your username, which is what extends the line you already have rather than issuing a second one — so your existing details keep working and nothing on your devices needs changing.

No prices are shown in the app. They live on the website, which is the only copy that can be kept current — a price built into an installed app would go on being shown after it changed. Where a device has no web browser, which is common on a television, the address is shown instead so you can open it on a phone.

Buffering, and why live and on-demand differ

Live and on-demand get different buffers from the same profile, on purpose. A film is a complete file, so holding more of it ahead of you protects against a slow network. A live channel is not: the provider keeps only a short rolling window of it, and asking for more than they have retained is a request for something already deleted. Buffering a live stream harder therefore makes it less reliable, not more.

If live playback stutters, the profile to try is a smaller one, not a larger one. If a film stutters, a larger one is the right move.

Voice

Say "Hey Enki" and then what you want, or use the Mic entry in the navigation. Commands cover playback, moving between sections, and finding something to watch — for example "browse live TV", "any new films", or "any sports on right now". A separate voice command guide lists the full set.

When something is wrong

Symptom	Where to look
Live stutters or stalls	Network → Live buffer profile. Try a <i>smaller</i> profile; see the buffering note above.
A film buffers	Network → VOD buffer profile. Try a larger profile.
Channels rejected with correct details	Playlists → the source's User-Agent. Some providers filter on it, which presents as a wrong password.
Second stream will not start	Your source's simultaneous-connection limit.
Guide is empty or wrong	Playlists → Refresh EPG, and the EPG timezone offset under Recording.
Catalogue looks stale	Playlists → Sync now.
